

EnerGuide Home Energy Evaluation — Sustainability Reference Note

Source: Natural Resources Canada / City of Toronto (Better Homes Toronto), current for 2026. An EnerGuide Home Energy Evaluation is a top-to-bottom assessment of a home's energy performance carried out by an NRCan-registered energy advisor, inspecting insulation, heating and cooling systems, air leakage, and overall energy use.

The evaluation produces an EnerGuide rating (the home's estimated annual energy consumption) and a homeowner report listing recommended upgrades ranked by impact. A pre-retrofit and a post-retrofit evaluation are typically required to qualify for and verify savings under most retrofit rebate and loan programs.

The EnerGuide Rating System is the standard NRCan uses to assess eligibility for energy programs, including CMHC's Eco Plus and Eco Improvement premium refunds.

Cost-of-ownership angle: a lower EnerGuide rating means lower ongoing energy costs across the ownership horizon, and the rating is an increasingly visible sustainability signal at resale. Getting an evaluation is the first step before financing efficiency upgrades.
